Creating a PostgreSQL Database

Two methods:
(1) At the command line

      createdb   db_name

      - user must have previously been granted permission to create databases
      - createdb is a "wrapper" for   "psql –d "

(2) Using the psql utility

      psql   db_name1

      CREATE DATABASE db_name2;

      - open psql utility for db_name1 and create a new db with name = db_name2

Get a list of previously created databases with "psql -l".

Database level privileges differ between Infx and psql
        - in psql, if user A creates a db, then user B automatically has access to it
           - Note: users A and B must be known to psql through the
                createuser command

        - in Infx: if user A creates a db, then user B does NOT have access to it unless
          granted CONNECT, RESOURCE or DBA privilege by user A

Max length of database name = 64 char
